

The Free Experiment

A home office checklist for reducing electromagnetic clutter — and rebuilding the boundary around it. Nothing to buy, nothing to sign up for. Just control a variable and watch what happens.

You just took the Home Office Scorecard — that's your starting line. Here's what to actually do with it.

Everything on this page addresses quantity — what's plugged in, what's transmitting, how much is stacked up around your desk. That's the half you can count and change yourself, starting tonight. There's a second half — quality — that doesn't show up on this list. More on that once you've worked through it.

Most home offices run **eight to twelve devices at once** without anyone deciding to put them there — a stacked, ordinary kind of electric smog most people stop noticing. None of what follows requires special equipment. Work through it in order: tonight's changes cost nothing, this week's take a few minutes, and the rest is just paying attention to a room you already sit in for eight hours a day.

01 Tonight — free

Nothing to buy. Most of these take under five minutes.

- ☐ Swap a wireless keyboard and mouse for corded ones — same job, no constant transmission. You probably already have these in a box from your last computer.
- ☐ Turn off the wifi connection on your own computer, right from its settings — no need to touch the router at all — during any stretch of work that doesn't need the internet.
- ☐ Turn off the printer between jobs instead of leaving it on standby.
- ☐ Move your phone out of arm's reach while you work — another room, not just face-down.
- ☐ Turn off Bluetooth on anything you're not actively using — earbuds, smartwatch, speaker, as well as your computer.

02 This week

Small changes, a few minutes each.

- ☐ Move the router off your desk — to the other side of the room if you can. Even a few feet helps.
- ☐ Move the power strip out from under your feet. It's easy to forget, but it likely sits closer to your body, for longer, than anything else in the room.
- ☐ Switch your main work computer to a wired connection where you can. It's faster, too, with far less EMF exposure.
- ☐ Check what's charging near your body all day — a phone charger under the monitor, a wireless charging pad — and move it further off.
- ☐ Notice what's behind you and in your peripheral vision: clutter, an open doorway, foot traffic. It affects focus even when you don't consciously register it.

03 Worth a look

Your desk's layout, not just what's on it.

- ☐ Where's the electrical panel relative to your desk? A shared wall is worth knowing about.
- ☐ Is your desk backed against a wall with wiring, a router, or another appliance on the other side?
- ☐ Count what's actually running while you work — laptop, monitor(s), keyboard, mouse, router, printer, lamp, purifier, the power strip underneath it all. Most people land between eight and twelve.
- ☐ Sit at your desk for a full minute with your eyes closed. Notice what you can hear, sense, or feel without looking.

04 Draw a boundary

Not everything running in the room is electronic.

- ☐ Build one small, physical signal that means "working" — a lamp on, a door mostly closed if you have one, or just a specific mat or cloth that only comes out when you're on the clock — something the rest of the house can actually see, since nobody can read your calendar from the kitchen.
- ☐ Build one small, physical signal that means "done" — close the laptop and put it out of sight, not just to sleep. Let the room look different at day's end than it did at midday.

05 Track it

You don't need to believe anything about energy to run this.

- ☐ Note how you feel at your desk — focus, fatigue, tension — before you start.
- ☐ Make one change from the lists above. Just one.
- ☐ Give it a few days. Then check back in with yourself, honestly.
- ☐ After a week, retake the Home Office Scorecard — bobby-ojvbin8.scoreapp.com — and see what moved.

Not "is this dangerous?" — but "is this necessary?"

A lot of what's running by default is there because no one asked. This isn't a diagnosis. It's a starting point.

This checklist handles quantity — what's plugged in, what's transmitting, how much is stacked up around your desk. That part's measurable with an ordinary meter, and this list gets you most of the way there for free. What it can't touch is quality — not something a meter picks up, but something the body already knows, whether or not you've put words to it yet.

That's the other half of the room, and it's the part I actually do this work to address. Run it for a week, retake the scorecard, and tell me what changed — even a couple lines in reply. I read every reply, and between the two, it's the easiest way to find out whether quantity was ever really the whole story.

Let's talk
